GENDER, OVERSCHOOLING AND JOB SATISFACTION AMONG SECONDARY SCHOOL EMPLOYEES IN UYO SENATORIAL DISTRICT OF AKWA IBOM STATE, NIGERIA

¹Eno Etudor-Eyo, Ukeme E. Eyo, Theresa M.Udofia, & Cecilia E. Ereh

Faculty of Education, University of Uyo, Nigeria 1 enoetudoreyo@yahoo.com

Abstract

This study was designed to replicate van der Meer's and Glebbeck's studies on overschooling in Netherland from 1982 to 2011. In this context, how male and female over/requiredschooled employees of public/private secondary schools differ in their job satisfaction was examined and described. Survey data were obtained from 486 secondary school employees randomly selected from 4548 population of teachers in Uyo Senatorial District's public and private secondary schools, using a questionnaire entitled 'Modified Minnesota Satisfaction Questionnaire (MMSQ)'. The findings were that more male than female employees are overschooled; public schools have more overschooled employees than private schools; male and female secondary school employees differ in their job satisfaction; male employees than females are more satisfied significantly in their job. Public/private schools employees differ significantly in their job satisfaction. Over/requiredschooled employees of public/private schools significantly differ in their job satisfaction. Over/requiredschooled employees differ significantly in their job satisfaction. Male and female over/requiredschooled employees of public/private secondary schools do not differ significantly in their job satisfaction. Several recommendations and implications were drawn from the study. Trends in the field relating to gender, salary, degree status, and numerous other factors were discussed along with recommendations for future research.

Keywords: Gender; Over/requiredschooling; School type; Job satisfaction

Introduction

This study has its strong basis, on series of studies on overschooling completed by van der Meer and Glebbeck, among other authors, in Netherland from 1982 to 2011. In this context, how male and female overschooled/requiredschooled employees of public/private secondary

schools differ in their job satisfaction was examined and described, van der Meer and Glebbeck, (2001) defined overschooling as the result imperfect allocation in the labour market: а situation where workers have a job below their qualification level. Job satisfaction describes how content an individual is with his /her job. The happier people

are within their job, the more satisfied they are said to be (Weiss, & Cropanzano, 1996). This definition suggests that people form attitudes towards their jobs by taking into account their feelings, their beliefs, and their behaviors, and in this case compare their credentials with their work.

The literature on overschooling shows that earnings are affected by how individuals' education matches that required by their occupation Johnson, & Ng, 2000). (Cohn, individuals with more Accordingly, their schooling than required by occupation have that tendency to shirk- not to work or work less than they are obliged to work according to ones contract- (emi1777, 2011). In 2001, van der Meer and Glebbeck conducted a study on displacement by better educated workers. According to the displacement thesis, the decline of the labour market position of lower educated workers is caused by the increase of the number of better educated workers. The result is an allocation in which many workers have a job below their qualification level the ('overschooling'), and lower educated, due to the lack of jobs, have been pushed out of the labour market into unemployment and, specifically in the Netherlands, into disablement. This line of research was contested by labour market economists (Hartog, 2000) who claimed that, according to theory, capital the human still overschooled years were productive and that, therefore, the education not wasted. was Overschooled employees were not as

perfectly schooled productive as employees were. This implies that an employee is paid according to his productivity. Also (marginal) overschooled years, if present, are paid according to this mechanism. If an employer does not pay for these characteristics of productive employee he or she will try to find a new job at another employer who will pay for these extra years of schooling because he/she needs satisfaction on the job (Rubb, 2005). On the other hand, Leuven and Oosterbeek (2010) discussed how overschooling level of underschooling at the workers have been individual measured, and what the incidence of overschooling and underschooling is. The authors concluded that due to issues concerning endogeneity and measurement error, the estimated (for) returns to required/under/overschooling cannot be interpreted as causal.

In 2001, van der Meer and Glebbeck posed a question: Has the amount of overschooling in Netherlands increased from 1982 to 1998 and did this affect the rate of return on schooling? Using data from the Labour Supply Panel survey and its predecessor, it was shown that the incidence and amount of overschooling did not increase from 1985 to 1998. However, some differences between men and women were found. van der Meer and Glebbeck found that men frequently more have become overschooled women less and frequently so. Despite an increase in the labour force's level of education, the rate of return on schooling had reached seven per cent as at then. An increase in the rate of return on overand underschooling were also found, implying an increasingly important role of education on the labour market.

In a similar vein, McGuiness sought to investigate the (2007)influence of gender on overeducation and found that the husbands' iob seeking takes place in a global market, the wives are largely whereas restricted to a regional labour market, exposing her to a higher relative risk of overeducation. This hypothesized inverse relationship between genderbased overeducation probabilities and size termed is labour market overqualification'. In 'differential (1995), Athey and Hautaluoma studied preferences of employment on representatives in personnel regarding iob electronics firms varying levels with of applicants applicants had education. The obtained a 4-year college degree, completed 2 years of college, or completed high school. The stimulus jobs required the equivalent of a high school education but varied in terms of status and gender stereotype. The personnel representatives tended to college-educated recommend applicants for higher status jobs and male stereotypic jobs and applicants who had high school degrees for lower status and female stereotypic jobs. Contrary to the results of most previous research on overschooling, the performance of the applicants who were college graduates was expected to be higher than that of the less educated applicants.

More so, Van der Meer (2001) investigated whether the amount and level of overschooling is higher in the private sector than in the public sector. Differences in the rate of return on (over)schooling too were also investigated. These differences should

result in different wage equations. Employees in the private sector were more often overschooled than those in the public sector, but the rate of return on overschooling is the same. This means that none of the investments in education is wasted; moreso, the increase in the rate of return on schooling since 1985 shows that investments in education have become even more rewarding.

Lenton, (2011) conducted study on overeducation across British Regions. The paper analysed levels of over-education and wage returns to education for males across eleven regions of the UK using Labour Force Survey data. Significant differences were found in the probability of being over-educated across regions; also, differences were found in the return to the 'correct' level of education in each region, in each case associated with flexibility of movement between and which particular regions, into determined the ease of job matching. Furthermore, evidence was found that, after controlling for the level education acquired, there existed a premium to the 'correct' level of education, which varied across UK regions.

To this end, therefore, though overschooling is regarded as the result of imperfect allocation in the labour despite several research market; reports about increasing incidence of related overschooling as unemployment, wages, mismatch in the labour market among other factors in the Netherlands and other countries of the world (van der Meer, 2001), hardly any attention has been given to the influence of overschooling on job satisfaction. It can be argued that almost all that are overschooled, whether self or government employed, are not satisfied. Hence, the need for this study on gender, over/requiredschooling and job satisfaction among secondary school employees (teachers) in Uyo Senatorial District of Akwa Ibom State, Nigeria.

Problem Statement

It is often observed that some employees are unhappy with the teaching work. Some have linked this state of unhappiness to inadequate compensation, unsafe or unhealthy conditions, and unrealistic expectations (Wikipedia 2011). Some male and female University graduates of different levels, specialisations, and qualifications employed in public and private secondary schools, have in one time or another gone in search for greener pastures (Field Experience, 2003-2005). Some have chosen absenteeism as a way of especially in the public schools where supervision monitoring seem and inadequate (Etudor & Ntukidem, 2006). The highest requirement for teachers in Nigerian secondary schools is a Postgraduate Diploma in Education (PGDE) (Federal Republic of Nigeria, FRN, many, 2004), yet though receiving wages according Government's stipulated qualification, are teaching with master's degree and some with a Doctor of Philosophy (PhD). This, according to van der Meer Glebbeck, (2001),is overschooling. Therefore, this study sought to investigate whether the unhappy state of some employees in secondary schools caused is overschooling.

Purpose of the Study

The purpose of the study was to investigate whether the unhappy state of some male and female employees

(teachers) in secondary schools in Uyo Senatorial District of Akwa Ibom State, Nigeria, is caused by overschooling.

Research Questions

- What is the difference between male and female in over/requiredschooled employees?
- 2. What is the difference between public and private employers in over/requiredschooling?

Hypotheses

- 1. Employees in public and private schools do not differ significantly in their job satisfaction.
- 2. Male and female secondary school employees do not differ significantly in their job satisfaction.
- 3. Over/requiredschooled employees do not differ significantly in their job satisfaction
- 4. Male and female over/requiredschooled employees do not significantly differ in their job satisfaction.
- 5. Over/requiredschooled employees of public/private secondary schools do not differ significantly in their job satisfaction.
- 6. Male and female over/requiredschooled employees of public/private secondary schools do not differ significantly in their job satisfaction.

Method

This research was descriptive and inferential in nature. Survey data were obtained from 486 secondary school employees in Uyo Senatorial District. Two hundred and ninety one employees (291) (male=176, female=115) were obtained from public secondary schools, while 195 employees (male=104, female=91)

were obtained from private secondary schools. This sample constituted 10% of 2911 and 1943 population of teachers in Uyo Senatorial District's public and private secondary schools, respectively. The research instrument used was a questionnaire entitled 'Modified Minnesota Satisfaction Questionnaire (MMSQ)'. The MMSQ had two sections A and B. Section A elicited demographic data including school type, employee's gender and qualification. Section B contained 20 items to measure employees' job satisfaction.

The face validity of MMSQ assessed by three was research experts and the reliability was obtained through a field study on 20 employees from Eket Senatorial District who were not included in the

actual study. The data obtained were subjected to Cronbach-alpha analysis which yielded a coefficience of .78. The instrument was, therefore. administered by the researchers with the help of three trained research assistants, after obtaining permission from the authority of each school selected for the study. The data obtained were analysed using, descriptive statistics, t-test, and univariate analysis. For an employee to be termed overschooled he/she must have earned a higher degree (e.g. Master's, PhD) than required Postgraduate Diploma in Education for teaching in the secondary school. All the hypotheses were tested at .05 alpha levels.

Results Table 1

Gender * Schooling Crosstabulation

			Schoo	ling	Total

that public schools (16.3%) have more overschooled employees than private schools (6.4%).

In Table 2, the crosstabulation between public/private school type and over/requiredschooling reveals

Table 3Result of Independent t-Test Analysis for the Difference Between Male and Female Secondary Schools Employees in their Job Satisfaction

Gender	N	Mean	Std. Deviation	t
Male	280	19.9571	2.20742	3.265 [*]
Female	206	19.1748	3.07604	

^{*}Significant at .05 alpha level; df=484; Critical t = 1.649

Entries in Table 3 reveal a greater group mean of 19.96 for male employees as against the group mean of 19.17 for female employees in their job satisfaction. This result implies that male employees are more satisfied in their job than their female counterparts. The Table reveals that the calculated t-value of 3.265 at .05 alpha level with 484 degree of

freedom is greater than the critical tvalue of 1.649. The result is significant, therefore, the null

hypothesis that male and female secondary school employees do not differ in their job satisfaction is rejected. By implication, gender contributes to employees' level of satisfaction on the job.

Table 4

Result of Independent t-Test Analysis for the Difference Between Public and Private Secondary Schools Employees in their Job Satisfaction

School Type	N	Mean	Std. Deviation	t
=_blic	291	19.900	2.30600	2.287*
=- vate	195	19.2154	3.02477	

^{*5} Inificant at .05 alpha level; df=484; Critical t = 1.649

The result in Table 4 shows that the calculated t-value of 2.287 is greater than the critical t-value of 1.649 at 05 alpha level with 484 degree of feedom. This result is significant, the null hypothesis that alpha do not differ significantly in the job satisfaction is rejected. The

Table further reveals that employees in private schools are less satisfied in their job (mean=19.22) than those in secondary public (mean=19.90). The testing of this hypothesis, therefore, that implies public/private school type can determine employees' jobs satisfaction.

Table 5Result of Independent t-Test Analysis for the Difference Between Over/Required schooled Employees in Their Job Satisfaction

5chooling	N _.	Mean	Mean Std. Deviation	
Requir ed	376	20.0160	2.11276	6.269 [*]
Over	110	18.2909	3.64061	

^{*}Significant at .05 alpha level; df=484; Critical t=1.649

In Table 5, it is shown that the group of employees who are overschooled has the lower mean score of 18.2909 as compared with the greater mean score of 20.02 for the group of secondary school employees who are requiredschooled, their iob in satisfaction. The result implies that who employees experience overschooling are less satisfied with their job than those who experience required-schooling. It is also shown in Table 5 that the calculated t-value of 6.269 is greater than the critical tvalue of 1.649 at .05 alpha level, with 482 degree of freedom. Therefore, the hypothesis null that over/requiredschooling employees do not differ significantly in their job satisfaction is rejected. This result placement means that iob employees has an impact on their job satisfaction level.

School Type	N Mea		Std. Deviation	t
Public	291	19,900	2.30600	2.287
Private	195	19.2154	3.02477	

*Significant at .05 alpha level; df=484; Critical t = 1.649

The result in Table 4 shows that the calculated t-value of 2.287 is greater than the critical t-value of 1.649 at 05 alpha level with 484 degree of freedom. This result is significant, hence, the null hypothesis that employees in public and private schools do not differ significantly in their job satisfaction is rejected. The

Table further reveals that employees in private schools are less satisfied in their job (mean=19.22) than those in secondary public (mean=19.90). The testing of this hypothesis, therefore, implies that school public/private type can determine employees' iobs satisfaction.

Table 5Result of Independent t-Test Analysis for the Difference Between Over/Required schooled Employees in Their Job Satisfaction

Schooling	N .	Mean Std. Deviation		t
Required	376	20.0160	2.11276	6.269 [*]
Over	110	18.2909	3.64061	

^{*}Significant at .05 alpha level; df=484; Critical t = 1.649

In Table 5, it is shown that the group of employees who are overschooled has the lower mean score of 18.2909 as compared with the greater mean score of 20.02 for the group of secondary school employees who are requiredschooled, in their iob satisfaction. The result implies that who experience =~ployees perschooling are less satisfied with Teir job than those who experience Teduired-schooling. It is also shown in Table 5 that the calculated t-value of 6.269 is greater than the critical t-value of 1.649 at .05 alpha level, with 482 degree of freedom. Therefore, the null hypothesis that over/requiredschooling employees do not differ significantly in their job satisfaction is rejected. This result means that job placement of employees has an impact on their job satisfaction level.

a R Squared = .268 (Adjusted R Squared = .257)

Dependent Variable: Job Satisfaction

Entries in Table 8 reveal the test of between subjects effects of all the variables considered in the study. The calculated F-values of 2.850 for gender and schooling, 21.514* for gender and school type (public or private); 98.422* for schooling and school type; and

3.174 for gender, schooling and school type (as joint influence on employees job satisfaction) are all compared with the critical F-value of 3.86 at .05 level of significance with 1 and 485 degrees of freedom. Only factors with asterisk (*) are significant while others are not. This result is not significant; hence, the null hypothesis that male and female over/requiredschooled

employees of public/private secondary schools do not differ significantly in their job satisfaction is retained. The results mean that all the factors (gender, required or overschooling, and school type) taken together do not jointly determine job satisfaction of employees. The R² value of .268, means that gender (male/female), schooling (over/required), and school type (public or/and private) account only 27% variability job in for satisfaction scores.

Discussion

The study reveals that more males female employees are than overschooled. It further reveals that female and male secondary school their differ in employees satisfaction. Besides, male employees are more satisfied in their job than their female counterparts. This result implies that, gender contributes to employees' level of job satisfaction. gender impact ٥f The over/requiredschooling on employees' job satisfaction further yielded a significant result. The finding is not consistent with the findings by van der Meer and Glebbeek (2001) that, some differences between men and women were found; men have become more frequently overschooled and women less frequently overschooled..

This study revealed that schools have more public/private overschooled employees than private that, schools. reveals also It can school type public/private determine employees' job satisfaction. Employees in private schools are less satisfied in their job than those in public secondary schools. School type with over/requiredschooling exerted a significant influence on employees' job satisfaction. The finding is at variance with the findings by van der Meer and Glebbeek (2001) that level of overschooling is higher in the private sector than in the public sector. Differences in the findings could be explained by environmental factors or by employees' preferences.

In this study it is shown that over/requiredschooled employees significantly their job differed in satisfaction. This result means that job placement of employees has an impact satisfaction level. their iob on Moreover, employees who experienced overschooling were less satisfied with their job than those who have the required credentials. The finding is in consonance with emi1777's (2011) assertion that individuals with more their schooling than required by occupation have that tendency to shirk (not to work or work less than they are obliged to work according to your Little wonder the contract). explanation that displacement is the process consequence Οf a competition on the supply side of the which market, is thus labour independent market from labour demand. Individuals improve their own educational credentials to enhance their competitiveness in the labour market. Since each individual follows the same strategy, the result is a rapid increase in the educational credentials of the working population, though every individual occupy about the same position in the labour queue (Hirsch, Thurow, cited in van der Meer & Glebbeck, 2001). Employers choose, ceteris paribus, the better educated worker because of the presumed higher productivity or lower training costs, even if the job is better suited for lower educated workers. The result is an allocation in which many workers have a job below their qualification level '('overschooling'), and the lower educated, due to the lack of jobs, have been pushed out of the labour market into unemployment. (van der Meer & Glebbeck, 2001).

When dender, overschooling/requiredschooling* school type influence were jointly tested on employees' job satisfaction, the result was not significant. Only 27% variability in job satisfaction scores were explained by gender or/and female), (male and over/requiredschooling, public/private school type. The finding is not consistent with the findings by van der Meer and Glebbeek (2001) that, some differences between men and women were found; men have become more frequently overschooled and women less frequently so. On the contrary, the finding is in consonance with the finding by McGuiness (2007) gender influence of when overeducation was investigated. It was shown found that the males' job seeking takes place in a global market, whereas the females' are largely restricted to a regional labour market exposing her to a higher relative risk of overschooling. Therefore, authors in this study claim that more males than female employees are overschooled; public schools have more that overschooled employees than private schools; and that the overschooled are not satisfied on the job. For more results. generalisation of researchers intend to conduct a study unemployment, underschooling mismatch in the labour market, as dentified by van der Meer & Glebbeck, 2001) and their impact on job employees. satisfaction among observations Interviews, cocument analysis would be carried extent of the cut to ensure everschooling in the area.

Conclusion

From the findings of the study, it was concluded that more males than female employees are overschooled; female and male secondary school employees differ in their job satisfaction; male employees are more satisfied in their job than the female counterparts.

Public schools have more overschooled schools. private employees than can Public/private schools type determine employees' job satisfaction. Employees (teachers) in schools are less satisfied in their job public secondary than those in with School schools. type over/requiredschooling exerts а significant influence on employees' job Over/requiredschooled satisfaction. employees differ significantly in their Gender, satisfaction. iob overg/requiredschooling school and jointly influence do not employees' job satisfaction.

Recommendations

Based on the findings of the study, the following recommendations were made:

- 1. the state government should provide a stimulating workplace environment, which fosters happy, motivated and empowered individuals;
- the government should promote
 a work environment that
 fosters personal and
 professional growth;
- 3. continual training and reinforcement should be given overschooled secondary bν the employees school order to government in develop a work force that is competent, consistent. effective 275 competitive, efficient;

4. the Tertiary Institutions authority should curl all overschooled secondary school employees (i.e. those with Master's Degree and PhD), conduct screening on them, and employ those that are employable.
